

Google Search Console Data Analysis and Optimisation

Website link: <https://vardan.blog147.com/>

Introduction:

What is Google Search Console?

Google Search Console (GSC) is a free service offered by Google that helps website owners, marketers, and SEOs monitor, maintain, and troubleshoot their site's presence in Google Search results. It provides data on search performance, indexing status, and crawl errors, enabling users to optimise content and visibility.

Purpose of the project.

The objective of this project was to leverage Google Search Console data to enhance website visibility, search performance, and technical health. We primarily focused on indexing crawl errors and search performance to implement content and technical improvements based on these insights.

Data Analysis:

- Key findings (CTR, clicks, impressions)

Problems Identified:

- Low CTR pages – Currently, the data are very limited since this is a demo site. The clicks and impressions are quite low, and as a result, the CTR is nearly negligible. Despite the limited data, I treated this as a practical experience to learn from these early signals.
- Indexing issues – Initially, some pages were not being indexed. We manually inspected each URL using the URL Inspection tool in Google Search Console and requested indexing for them. By repeating this process, we were able to successfully get all the pages indexed. We went to the page indexing tool in Google Search Console and submitted them manually. Since then, we have successfully improved the indexing status.

Optimisation Strategy:

- What I changed and why

We focused on stimulated or hypothetical improvements. Essentially, we brainstormed how we would optimise titles, ensure indexing, or enhance mobile-friendliness if we had real-world data. This served as a practical exercise to prepare us to apply these skills in a live production environment.

We optimise titles and descriptions to increase CTR (click-through rate), with an SEO focus to ensure the content targets the right keywords and appears more prominent in search results. Every change was aimed at boosting visibility and improving user engagement.

Implementation:

- Steps you actually did:
 - First, the website and its pages were developed, followed by internal linking from the home page.
 - We then added titles and descriptions to ensure they were SEO-friendly.
 - After completing these steps, we implemented content and technical updates to boost indexing and improve the CTR.
 - After indexing all the pages, we analysed their performance metrics such as impressions, clicks, and CTR (click-through rate) and used that data to plan for the improvements.

- We conducted a data analysis and identified which specific pages required further optimisation. For instance, if a page were underperforming, we planned targeted changes to its title, content, or technical elements. This is essentially what we mean by future improvement and an action plan based on data.

Results:

- Improvements observed

Since this is a demo website, we envision hypothetical improvements. For instance, if data volume were to increase, we would expect a rise in CTR, complete indexing, and improved search rankings.

In other words, we projected these improvements theoretically to gain a practical learning experience.

We documented the initial metrics, such as 0 clicks, 3 impressions, no CTR yet, but an average position of 2.3. We successfully indexed the pages and performed URL inspections. Even though the current performance is minimal, a real-world project would offer significant opportunities for optimisation and traffic growth in this way. Despite being a demo, it provided a valuable learning experience.

Conclusion:

- What you learned

Through this project, I learnt how to effectively utilise Google Search Console, whether it involves:

- Measuring CTR
- Monitoring clicks and impressions
- Indexing pages
- Performing URL inspection

I gained hands-on experience in optimisation techniques, mobile-friendly testing, resolving crawl errors, and developing strategies to improve CTR. Overall, I developed a comprehensive understanding of the entire process required to analyse and optimise a website.
